- (54) Title: IMMUNOSTIMULATORY OLIGONUCLEOTIDES AND USES THEREOF

(57) Abstract: Oligonucleotides containing the non-palindromic sequence motif $X_1X_2X_3X_4X_5X_6X_7X_8$, wherein X_1 is C or T, X_2 is C, T, G or A, X_3 is T or A, X_4 is T, C or G, X_5 is T, C or G, X_6 is T or G, X_7 is G and X_8 is T and wherein at least two of X_3 , X_4 , X_5 and X_6 are Ts and wherein C never precedes G (in other terms, the nucleic acid motif does not consist of a CpG oligonucleotides) that have the ability to stimulate the immune response of animals of the order *Primate*, including humans are disclosed. The stimulation of the immune response is characterized by stimulation of proliferation, differentiation, cytokine production and antibody production in B-cells and cell differentiation and cytokine production in plasmacytoid dendritic cells.

WO 03/101375 A2

IMMUNOSTIMULATORY OLIGONUCLEOTIDES AND USES THEREOF

FIELD OF THE INVENTION

The present invention refers especially to oligonucleotides containing the non-palindromic sequence motif:

5 $X_1X_2X_3X_4X_5X_6X_7X_8$,

wherein X_1 is C or T, X_2 is C, T, G or A, X_3 is T or A, X_4 is T, C or G, X_5 is T, C or G, X_6 is T or G, X_7 is G and X_8 is T and wherein at least two of X_3 , X_4 , X_5 and X_6 are Ts and wherein C never precedes G. These oligonucleotides were shown to be immunostimulatory in animals of the order *Primate*, including
10 humans.

BACKGROUND OF THE INVENTION

The immune system

The major function of the immune system is to protect the host from invading
15 pathogens. A number of different cell types, both antigen-independent and
antigen-specific, have evolved to detect and neutralize these invading
pathogens. Among them, lymphocytes have an important characteristic,
which is their ability to specifically recognize antigens, a feature not
possessed by any other cell. This means that any lymphocyte function
20 stimulated by an antigen is directed solely at that antigen.

Lymphocytes may be divided into two major populations: T and B. T-
lymphocytes have a central role in regulating the immune response and for

this they produce and secrete lymphokines (i.e. interleukins). On the other hand, B-lymphocytes are the only cells that produce antibodies, which are proteins that recognize and bind antigens.

Some T-lymphocytes are known as helpers (Th-lymphocytes) because they
5 assist B-cells to produce antibodies. T-lymphocytes express a characteristic membrane molecule designated CD4. Other T-lymphocytes are known as cytotoxic (CTL) because they are capable of killing certain cells. They express a different characteristic membrane protein designated CD8.

In mice, Th-lymphocytes have been subdivided in groups which are
10 designated Th0, Th1 and Th2, according to the lymphokines they produce. In general, Th1 lymphocytes produce lymphokines which stimulate macrophages and CTLs (IL2, IFN γ , TNF- β); Th2 lymphocytes produce lymphokines which stimulate B-lymphocytes to proliferate and to produce antibodies (IL 2, IL5, IL6, IL10, IL13); and Th0 lymphocytes produce a mixture
15 of lymphokines and are thought to be an intermediate stage from which Th1 and Th2 lymphocytes are derived. In humans, Th1- and Th2- like lymphocytes have been demonstrated, although they seem to show a less strict division with respect to their patterns of cytokine secretion.

A third population of lymphocytes, which lack the major markers of T and B
20 cells include the natural killer cells (NK cells), the killer cells (K cells) and the lymphokine-activated killer cells (LAK cells). NK cells can kill certain tumor cells and some virally infected cells, but unlike cytotoxic T-lymphocytes, they

are not capable of recognizing a specific antigen. First, they can bore a hole in a target cell by secreting perforin molecules to form a membrane attack complex on the surface of the target. NK cells can then secrete enzymes that enter the target cell and cause it to commit suicide. As a second mechanism of destruction, Fas ligand, a protein present on NK cells can interact with Fas, another protein present on the surface of the target cell, inducing the target cell to commit suicide by apoptosis. NK cells are also able to bind to cells, which have antibody to them via their antigen-binding regions and kill them. L

5 A K cells do not specifically recognize an antigen but they are capable of destroying a wider range of targets than NK cells.

10

Macrophages and dendritic cells play a critical role in initiating immune responses, helping T cells to respond to antigens.

There are several classes of antibody. The IgG class comprises most of the circulating antibodies and it has four subclasses designated IgG1, IgG2, IgG3 and IgG4. The IgM class comprises about 10 % of the circulating antibodies.

15

These are the principal antibodies produced during the primary immunological response. The IgA class comprises most of the antibodies secreted at mucous membranes and exerts its protective effect by blocking access of the antigen to the inner body. The IgD class comprises less than 1

20 % of serum antibodies and its biological role is largely unknown. The IgE class comprises antibodies that are mainly bound to the surface of most cells

and basophils. These antibodies are associated with reactions that occur in individuals who are undergoing allergic reactions.

Vaccines and vaccine adjuvants

5 Vaccines are preparations used to stimulate animals to mount an immune response against antigens included in the vaccine.

Vaccines often include adjuvants, which are substances that used in combination with specific antigen produce more immunity than the antigen used alone. (Ramon, G., 1926. Procédes pour accroître la production des
10 antitoxins. Ann. Inst. Pasteur. 40, 1- 10).

Many kinds of compounds function as vaccine adjuvants (Edelman, R., 2000. An overview of adjuvant use, in : Vaccine Adjuvants. Preparation Methods and Research Protocols. D.T. O' Hagan, Ed., Humana Press, Totowa, New Jersey. References cited in this article are incorporated herein as background
15 material).

However, currently, the only adjuvants approved for use in humans are aluminum salts (Gupta, R.K. and Rost, B.E., 2000. Aluminum compounds as vaccine adjuvants in: Vaccine Adjuvants. Preparation Methods and Research Protocols. D.T. O' Hagan, Ed., Humana Press, Totowa, New Jersey) and the
20 oil-in-water emulsion M F 59 (Ott, G. Radhakrishnan, R. Fang, J. and Hora, M., 2000. The adjuvant M F 59: A 10- Year Perspective, in : Vaccine

Adjuvants. Preparation Methods and Research Protocols. D.T. O' Hagan, Ed., Humana Press, Totowa, New Jersey).

Nucleic acids as immunostimulatory compounds

- 5 Several polynucleotides have been demonstrated to have immunostimulatory properties. For example, poly (I,C) is an inducer of interferon (IFN) production, macrophage activation and NK cell activation (Talmadge, J.E., Adams, J., Phillips, H., Collins, M., Lenz, B., Schneider, M., Schlick, E., Ruffmann, R., Wilttrout, R.H., Chirigos, M.A.1985. Immunomodulatory effects
- 10 in mice of polyinosinic-polycytidylic acid complexed with poly-L-lysine and carboxymethylcellulose. Cancer Res. 45:1058; Wilttrout, R.H., Salup, R.R., Twilley, T.A., Talmage, J.E. 1985. Immunomodulation of natural killer activity by polyribonucleotides. J. Biol. Resp. Mod. 4:512), poly (dG,dC) is mitogenic for B cells (Messina, J.P., Gilkerson, G.S., Pisetsky, D.S. 1993. The influence
- 15 of DNA structure on the in vitro stimulation of murine lymphocytes by natural and synthetic polynucleotide antigens. Cell. Immunol. 147:148) and induces IFN and NK activity (Tocunaga, T., Yamamoto, S., Namba, K.1988. A synthetic single-stranded DNA, poly(dG,dC), induces interferon- α/β and - γ , augments natural killer activity, and suppresses tumor growth. Jpn. J. Cancer
- 20 Res. 79:682).

Bacterial DNA has also been reported to have immunostimulatory properties. These properties include the induction of cytokines (interferon gamma (IFN γ),

alpha (IFN α) and beta (IFN β)), tumor necrosis factor alpha (TNF α), interleukin 6 (IL6), 12 (IL 12) and 18 (IL 18), as well as the direct stimulation of B cells (Yamamoto, S. et al. 1988. In vitro augmentation of natural killer cell activity of interferon α/β and γ with deoxyribonucleic acid fraction from
5 *Mycobacterium bovis* BCG. Jpn. J. Cancer Res. (Gann) 79: 866-873; Yamamoto S. et al., 1992. DNA from bacteria, but not from vertebrates, induces interferons, activates natural killer cells and inhibits tumor growth. Microbiol. Immunol. 36: 983-997; Klinman, D.M., Yi, A-K., Beaucage, S.L., Conover, J. and Krieg, A.M.,1996. CpG motifs present in bacterial DNA
10 rapidly induce lymphocytes to secrete interleukin 6, interleukin 12 and interferon γ . Proc. Natl. Acad. Sci. USA 93, 2879-2883. Halpern, M. D., et al. 1996. Bacterial DNA induces murine interferon γ production by stimulation of interleukin γ -12 and tumor necrosis factor α . Cell. Immunol. 167: 72-78. Sparwasser, T. et al.,1997. Macrophages sense pathogens via DNA motifs:
15 induction of tumor necrosis factor α - mediated shock. Eur. J. Immunol. 27: 1671-1679; Krieg, A.M. et al., 1995. CpG motifs in bacterial DNA trigger direct B-cell activation. Nature 374: 345-349).

In contrast, it has been reported that mammalian DNA has no significant immune effects (Pisetsky, D.S. 1996. The immunologic properties of DNA. J.
20 Immunol. 156: 421-423; Messina et al. 1991. Stimulation of in vitro murine lymphocyte proliferation by bacterial DNA. J. Immunol. 147: 1759).

Synthetic DNA has also been reported to be immunostimulatory if it contains unmethylated CpG motifs. (Yamamoto, S et al.; 1992. Unique palindromic sequences in synthetic oligonucleotides are required to induce INF and augment INF-mediated natural killer activity. J. Immunol. 148: 4072-4076; 5 Ballas, Z.K., et al.; 1996. Induction of NK activity in murine and human cells by CpG motifs in oligodeoxynucleotides and bacterial DNA. J. Immunol. 157: 1840-1845; Hartmann, G., Krieg, A.M. 2000. Mechanism and function of a newly identified CpG DNA motif in human primary B cells. J. Immunol. 164:944; Hartmann, G., Weeratna, R.D., Ballas, Z.K., Payette, P., Blackwell, 10 S., Suparto, I., Rasmussen, W.L., Waldschmidt, M., Sajuthi, D., Purcell, R.H., Davis, H.L., Krieg, A.M. 2000. Delineation of a CpG phosphorothioate oligodeoxynucleotide for activating primate immune responses in vitro and in vivo. J. Immunol. 164:1617; Verthelyi, D., Ishii, K.J., Gursel, M., Takeshita, F., Klinman, D.M. 2001. Human peripheral blood cells differentially recognize and 15 respond to two distinct CpG motifs. J. Immunol. 166:2372). However, one oligonucleotide containing phosphorothioate bonds that lack CpG motifs has been found to have some immunostimulatory activity on human B cells (Liang, H., Nishioka, Y., Reich, C.F., Pisetsky, D.S., Lipsky, P.E. 1996. Activation of human B cells by phosphorothioate oligonucleotides. J. Clin. 20 Invest. 98:1119). This particular non-CpG oligonucleotide containing phosphorothioate bonds is a poly-T chain, 20 nucleotides long. Also, Vollmer et al (Vollmer J, Janosch A, Laucht M, Ballas ZK, Schetter C, Krieg AM.

Highly immunostimulatory CpG-free oligodeoxynucleotides for activation of human leukocytes. Antisense Nucleic Acid Drug Dev.12:165-175, 2002) reported immunostimulation by phosphorothioate poly-T ODNs. These authors pointed out that poly-T ODNs are only active as phosphorothioate
5 ODNs and have much lower activity than CpG ODNs.

It has now been discovered that non-CpG oligonucleotides containing the following non-palindromic sequence motif:

wherein X_1 is C or T, X_2 is C, T, G or A, X_3 is T or A, X_4 is T, C or G, X_5 is T, C or G, X_6 is T or G, X_7 is G and X_8 is T and wherein C never precedes G (in
10 other terms, the nucleic acid motif does not consist of a CpG oligonucleotides) have potent immunostimulatory activity in animals of the order *Primate* including humans. Therefore, these oligonucleotides can be administered to subjects to treat "immune system deficiencies" or used as
15 adjuvants, in conjunction with a vaccine, to boost the immune system in order to have a better response to the vaccine. They can also be administered to subjects to increase their responsiveness to tumors.

SUMMARY OF THE INVENTION

20 It has now been discovered that non-CpG oligonucleotides containing the following non-palindromic sequence motif:

wherein X_1 is C or T, X_2 is C, T, G or A, X_3 is T or A, X_4 is T, C or G, X_5 is T, C or G, X_6 is T or G, X_7 is G and X_8 is T and wherein at least two of X_3 , X_4 , X_5
25 and X_6 are Ts and wherein C never precedes G (in other terms, the nucleic

acid motif does not consist of a CpG oligonucleotides), have the ability to stimulate the immune response of animals of the order *Primate*, including humans.

According to a preferred embodiment, X_1 consists of a C. It is preferable if

5 $X_3, X_4, X_5, X_6, X_7, X_8$ of the immunostimulatory motif consists of TTTTGT, ATTTGT or ATTGGT. It is even more advantageous if X_1 is C; X_3 is T or A; X_4 is T; X_5 is T; X_6 is T or G; X_7 is G and X_8 is T.

The oligonucleotides of this invention are useful as adjuvants in a vaccine formulation comprising one or more antigens. In embodiments of this aspect,

10 the vaccine formulation can be liquid or lyophilized in dosage form. Many dosage forms are known in the art and can be applied herein. In embodiments of this aspect the oligonucleotides of this invention are present in the composition at a dose of from about 10 to 10,000 μg per dose. In these preparations, the oligonucleotides of this invention may be combined with
15 other immunostimulant compounds. Examples of well-known immunostimulants are: α -interferon, β -interferon, γ -interferon, granulocyte macrophage colony stimulator factor (GM-CSF), interleukin 2 (IL2), interleukin 12 (IL12) and CpG oligonucleotide.

In preferred embodiments, the antigenic component of the vaccine is one or
20 more antigens, either natural or recombinant, of viruses like: Human immunodeficiency viruses, such as HIV-1 and HIV-2, polio viruses, hepatitis A virus, human coxsackie viruses, rhinoviruses, echoviruses, equine encephalitis viruses, rubella viruses, dengue viruses, encephalitis viruses,

yellow fever viruses, coronaviruses, vesicular stomatitis viruses, rabies viruses, ebola viruses, parainfluenza viruses, mumps virus, measles virus, respiratory syncytial virus, influenza viruses, Hantaan viruses, bunga viruses, hemorrhagic fever viruses, reoviruses, orbiviruses, rotaviruses, Hepatitis B virus, parvoviruses, papilloma viruses, polyoma viruses, adenoviruses, herpes simplex virus (HSV) 1 and 2, varicella zoster virus, cytomegalovirus (CMV), variola viruses, vaccinia viruses, pox viruses, African swine fever virus, the unclassified agent of delta hepatitis, the agents of non-A, non-B hepatitis; or one or more antigens of infectious bacteria like: *Helicobacter pylori*, *Borrelia burgdorferi*, *Legionella pneumophila*, *Mycobacterium tuberculosis*, *Mycobacterium bovis* (BCG), *Mycobacterium avium*, *Mycobacterium intracellulare*, *Staphylococcus aureus*, *Neisseria gonorrhoeae*, *Neisseria meningitidis*, *Listeria monocytogenes*, *Streptococcus pyogenes*, *Streptococcus pneumoniae*, *Haemophilus influenzae*, *Moraxella catharralis*, *Klebsiella pneumoniae*, *Bacillus anthracis*, *Corynebacterium diphtheriae*, *Clostridium perfringens*, *Clostridium tetani*, *Enterobacter aerogenes*, *Klebsiella pneumoniae*, *Pasturella multocida*, and *Treponema pallidum*; of infectious fungi like: *Cryptococcus neoformans*, *Histoplasma capsulatum*, *Coccidioides immitis*, *Blastomyces dermatitidis*, *Candida albicans*; of infectious protists like: *Plasmodium falciparum*, *Trypanosoma cruzi*, *Leishmania donovani* and *Toxoplasma gondii*. and; of human tumoral cells.

In embodiments of this aspect, one or more of the oligonucleotides of this invention and the antigen are administered simultaneously locally (by oral, rectal, intranasal or transdermal route) or systemically (by intradermic or intramuscular injection).

- 5 An aspect of this invention is the use of the present oligonucleotides for the manufacture of a medicament for vaccinating a person. The person can be vaccinated *prophylactically or therapeutically*.

A *prophylactic* vaccine is designed to elicit protection from a disease caused by an infectious agent through the induction of specific immunity.

- 10 A *therapeutic* vaccine is designed to induce remission of an illness (i.e. a tumor and metastasis or illness associated with an infectious agent like the human immunodeficiency virus).

The method of vaccination includes administering one or more of the oligonucleotides of this invention and one or more antigens – that is, the vaccine can be designed against one disease target or a combination of
15 disease targets.

Another aspect of this invention is a method of treatment of a person with a tumoral disease or an immunological disorder, namely the use of one or more of the oligonucleotides of this invention for the manufacture of a medicament
20 to stimulate his/her endogenous immune response. Examples of tumoral disease are: Chronic Myelogenous Leukemia, Precursor B-lymphoblastic lymphoma, B-cell chronic lymphocytic leukaemia, Lymphoplasmacytic

lymphoma, Mantle cell lymphoma, Follicle center lymphoma, (follicular and diffuse), Marginal zone-B lymphoma, Extranodal lymphoma, Nodal marginal zone B-cell lymphoma, Splenic marginal zone B-cell lymphoma, Hairy cell leukaemia, Plasmacytoma, Diffuse large B-cell lymphoma, Burkitt's lymphoma, High grade B-cell lymphoma, Burkitt like, Melanoma, Kaposi's Sarcoma, Multiple Myeloma, Renal Cell Carcinoma, Bladder Cancer, Lung Cancer, Skin Cancer, Breast Cancer, Colon Cancer and Uterus Cancer. Examples of immunological disorders are: Allergy, Severe Combined Immunodeficiency, Chronic Granulomatous disease, and Acquired Immunodeficiency Disease.

In embodiments of this aspect, one or more of the oligonucleotides of this invention are present in a pharmaceutical formulation that can be liquid or lyophilized in dosage form. Many dosage forms are known in the art and can be applied herein. In embodiments of this aspect one or more of the oligonucleotides of this invention are present in the composition at a dose of from about 10 to 10,000 μg per dose. In these preparations one or more of the oligonucleotides of this invention may be combined with other immunostimulant compounds. Examples of well-known immunostimulants are: α -interferon, β -interferon, γ -interferon, granulocyte macrophage colony stimulator factor (GM-CSF), interleukin 2 (IL2), interleukin 12 (IL12), CpG oligonucleotides and *Mycobacterium bovis* BCG cells. Also, one or more of the oligonucleotides of this invention may be combined with an antiinfective or

anticancer drug, or a surgical procedure. In all these cases, the oligonucleotides of this invention may be administered before, after or simultaneously with the alternative treatment.

Another aspect of this invention is that a person with a tumoral disease or an immunological disorder could be treated by contacting lymphocytes or plasmacytoid dendritic cells from the subject, with one or more of the oligonucleotides of this invention "ex vivo" and readministering the activated cells to the subject. In embodiments of this aspect one or more of the oligonucleotides of this invention are present in the incubation media in a concentration of about 0.10 to 100 µg per ml.

BRIEF DESCRIPTION OF THE FIGURES

Fig. 1 is a graph plotting the proliferation index of human peripheral blood mononuclear leukocytes (PBMC) incubated with the phosphorothioate ODN IMT 023 (Seq. ID N° 9) or the phosphorothioate CpG ODN 2006:

5' TCGTCGTTTTGTCGTTTTGTCGTT 3' or the phosphorothioate non-CpG ODN IMT 021 (SEQ ID NO:1). Data represent the mean and standard deviation of five independent assays.

Fig 2 shows the results from a flow-cytometric study using human peripheral blood mononuclear leukocytes (PBMC) to determine the comparative effect of the phosphorothioate CpG ODN 2006:

5' TCGTCGTTTTGTCGTTTTGTCGTT 3'

or the phosphorothioate non-CpG ODN IMT 021 (SEQ ID NO:1) on activation of the B cell population. B cell activation was measured by the induction of CD86 on CD69 positive cells.

(a) Representative flow-cytometric diagrams comparing B cell activation by ODNs IMT023 (Seq. ID N^o 9), 2006 or IMT021 (SEQ ID NO:1); b) Representative histograms of the flow-cytometric diagrams showed in (a).

Fig. 3 is a graph plotting the proliferation index of PBMC incubated with the indicated phosphorothioate ODNs. Data represent the mean and standard deviation of five independent assays.

Fig. 4. shows the induction of CD86 in CD19+ (B) cells and CD69 in CD56 + (NK) cells by non-CpG ODNs claimed in WO 01/22972 . Human PMBC were cultured for 48 hr with indicated *phosphodiester* ODNs or controls and then stained with fluorescent-anti-CD19/anti-CD86 (a) or, anti-CD19/anti-CD40 (b) or, anti-CD19/anti-MHC I (c). Flow cytometric results are presented as histograms corresponding to cells in the double positive gate. Open histograms correspond to cells cultured in absence of ODN and shaded histograms to cells cultured in presence of ODN. ODN (O): phosphodiester ODN. ODN 2080, a CpG ODN of the following sequence: 5'-

TCGTCGTTCCCCCCCCCCCC-3' was used as positive control.

Fig. 5 shows the influence of the position of the immunostimulatory sequence motif X₁X₂X₃X₄X₅X₆X₇X₈ here disclosed on the immunostimulatory activity of

non-CpG ODNs measured in PMBC proliferation assays. Data represent the mean and standard deviation of three independent assays performed in quadruplicate.

Fig. 6 shows the induction of CD40, MHC I and MHC II in CD19+ cells (B
5 cells) by non-CpG-ODNs bearing the immunostimulatory sequence motif
 $X_1X_2X_3X_4X_5X_6X_7X_8$ here disclosed. Human PMBC were cultured for 24 hr with
indicated ODNs and then stained with fluorescent anti-CD19/anti-CD40 (a) or,
anti-CD19/ anti-MHC I (b) or, anti-CD19/ anti-MHC II (c). Flow-cytometric
results are presented as histograms corresponding to CD19+ cells. Open
10 histograms correspond to cells cultured in absence of ODN and shaded
histograms to cells cultured in presence of ODN. ODN (S) means
phosphorothioate ODN.

Fig. 7 shows the induction of CD86, CD40 and MHC I in purified B cells by
non-CpG-ODNs bearing the immunostimulatory sequence motif
15 $X_1X_2X_3X_4X_5X_6X_7X_8$ here disclosed. Human purified B cells were cultured for
24 hr with indicated ODNs and then stained with fluorescent anti-CD19/anti-
CD86 (a) or, anti-CD19/anti-CD40 (b) or, anti-CD19/anti-MHC I (c). Flow-
cytometric results are presented as histograms corresponding to CD19+ cells.
Open histograms correspond to cells cultured in absence of ODN and shaded
20 histograms to cells cultured in presence of ODN. ODN (S) means
phosphorothioate ODN.

Fig. 8 shows induction of CD86, CD40 and MHC I in CD19+ cells (B cells) by phosphodiester non-CpG-ODNs bearing the immunostimulatory sequence motif $X_1X_2X_3X_4X_5X_6X_7X_8$ here disclosed. Human PMBC were cultured for 48 hr with indicated phosphodiester ODNs and then stained with fluorescent anti-CD19/anti-CD86 (a) or, anti-CD19/anti-CD40 (b) or, anti-CD19/anti-MHC I (c). Flow-cytometric results are presented as histograms corresponding to CD19+ cells. Open histograms correspond to cells cultured in absence of ODN and shaded histograms to cells cultured in presence of ODN. ODN (O) means phosphodiester ODN.

Fig. 9 shows stimulation of PMBC proliferation by non-CpG ODNs bearing the motif $X_1X_2X_3X_4X_5X_6X_7X_8$ here disclosed in non-human primates. *Cebus apella* or *Macacca fascicularis* PMBC were cultured for 72 hr with indicated ODNs (6µg/ml). Data represent the mean and standard deviation of four replicates.

Fig. 10 shows the induction of CD86, CD40 and MHC I in CD 19+ (B cells) of a patient suffering B cell chronic lymphocytic leukemia (CLL) by non-CpG-ODNs bearing the motif $X_1X_2X_3X_4X_5X_6X_7X_8$ here disclosed. PMBC were cultured for 24hr with indicated ODNs and then stained with fluorescent anti-CD19/anti-CD86 (a) or, anti-CD19/anti-CD40 (b) or, anti-CD19/anti-MHC I (c). Flow-cytometric results are presented as histograms corresponding to CD19+ cells. Open histograms correspond to cells cultured in absence of ODN and shaded histograms to cells cultured in presence of ODN. ODN (S) means phosphorothioate ODN.

Fig. 11 shows the stimulation of malignant B cell apoptosis by non-CpG-ODNs bearing the motif $X_1X_2X_3X_4X_5X_6X_7X_8$ here disclosed. PMBC were cultured for 14 hr. or 5 days with indicated ODNs and then stained with propidium iodide and annexin V-FITC using the ANNEXIN V-FITC assay kit
5 from Serotec (Raleigh, NC, USA). Flow-cytometric results are presented as a dot-plot of annexin V-FITC fluorescence versus propidium iodide (PI) fluorescence. This plot show three cell populations: a) low PI-low annexin that are viable cells, b) low PI-high annexin that are apoptotic cells and, c) high PI-high annexin that are secondary necrotic cells.

10 Fig. 12 shows the induction of CD86, CD40 and MHC I in purified plasmacytoid dendritic cells by non-CpG-ODNs bearing the motif $X_1X_2X_3X_4X_5X_6X_7X_8$ here disclosed. More than 95 % pure plasmacytoid dendritic cells were cultured for 24hr with indicated ODNs and then stained with fluorescent anti-CD4/anti-CD11c/anti-CD86 (a) or, anti-CD4/anti-CD11c
15 /anti-CD40 (b) or, anti-CD4/anti-CD11c /anti-MHC I (c). Flow cytometric results are presented as histograms corresponding to CD4+CD11c- cells. Open histograms correspond to cells cultured in absence of ODN and shaded histograms to cells cultured in presence of ODN. ODN (S) means phosphorothioate ODN.

20 Fig. 13 is a graph plotting the IL-10 levels in supernatants of five independent human peripheral blood mononuclear leukocytes (PBMC) cultured 72 hr with

the phosphorothioate non-CpG ODN IMT 504 (Seq. ID N^o 2.), the phosphorothioate CpG ODN 2006: 5' TCGTCGTTTTGTCGTTTTGTCGTT 3', or the phosphorothioate non-CpG ODN IMT 022 (SEQ ID NO: 175). Data represent the mean and standard deviation of five independent assays.

- 5 Fig. 14 is a graph plotting the IL-5 levels in supernatants of five independent human peripheral blood mononuclear leukocytes (PBMC) cultured 96 hs with the phosphorothioate non-CpG ODN IMT 504 (Seq. ID N^o 2.), the phosphorothioate CpG ODN 2006: 5' TCGTCGTTTTGTCGTTTTGTCGTT 3', or the phosphorothioate non-CpG ODN IMT 022 (SEQ ID NO: 175). Data
10 represent the mean and standard deviation of five independent assays.

DETAILED DESCRIPTION OF THE INVENTION

Definitions:

- An "allergy" refers to acquired hypersensitivity to a substance (allergen).

- 15 Examples of allergies are eczema, allergic rhinitis, asthma and urticaria.

- An "immune system deficiency" refers to a disease in which the immune system is not functioning in normal capacity.

- As used herein, the term "oligonucleotide" or "oligo" shall mean multiple nucleotides (i.e. molecules comprising a sugar (e.g. ribose or deoxyribose)
20 linked to a phosphate group and to an exchangeable organic base, which is either a substituted pyrimidine (e.g. cytosine (C), thymine (T) or uracil (U)) or a substituted purine (e.g. adenine (A) or guanine (G)). The term

"oligonucleotide" as used herein refers to both oligoribonucleotides (ORNs) and oligodeoxyribonucleotides (ODNs). The term "oligonucleotide" shall also include oligonucleosides (i.e. an oligonucleotide minus the phosphate) and any other organic base containing polymer. Oligonucleotides can be obtained from existing nucleic acid sources (e.g. genomic or cDNA), but are preferably synthetic (e.g. produced by oligonucleotide synthesis).

- An "oligonucleotide" refers to multiple nucleotides linked by phosphodiester bonds.

- An "immunostimulatory oligonucleotide" refers to an oligonucleotide which stimulates (i.e. has a mitogenic effect on, or induces or increases or decreases cytokine expression by) a cell of the immune system (i.e.: a lymphocyte, a macrophage) in a statistically significant manner.

- A "Strong immunostimulatory oligonucleotide" refers to an oligonucleotide which stimulates "in vitro" cells of the immune system of an animal of the order Primate with an activity of at least 60% of the immunostimulatory activity of the well known CpG ODN 2006, under the same experimental conditions and using identical chemical backbone (i.e. phosphorotioate backbone or phosphodiester backbone).

- A "CpG" refers to a cytosine-guanine dinucleotide.

- A "CpG oligonucleotide" refers to an oligonucleotide which stimulates a cell of the immune system and its immunostimulatory activity critically depends on the presence of at least one CpG in its sequence.

- A "non-CpG oligonucleotide" refers to an oligonucleotide which stimulates a cell of the immune system and its immunostimulatory activity does not critically depends on the presence of a CpG in its sequence.
- A "subject" refers to an animal of the order Primate, including humans.
- 5 - As used herein, the term "treating" refers to a process by which the symptoms of a disease, and more particularly, infectious diseases, tumoral diseases or immunological disorders are ameliorated or completely eliminated.
- As used herein, the term "preventing" refers to a process by which a
10 disease, and more particularly infectious diseases or tumoral diseases or immunological disorders are obstructed or delayed.
- In a preferred embodiment, the immunostimulatory oligonucleotides of the invention are advantageously modified into stabilized oligonucleotides. Such stabilized immunostimulatory oligonucleotide may be particularly useful to
15 obtain a prolonged immunostimulation. As used herein, a "stabilized oligonucleotide" refers to an oligonucleotide that is relatively resistant to in vivo degradation (e.g. via an exo- or endo-nuclease). Preferred stabilized oligonucleotides of the present invention comprise a phosphate backbone modification. More particularly, the phosphate backbone modification is
20 preferably a 5' inter-nucleotide linkage modification, for instance, at the first two nucleotides of the 5' end of the oligonucleotide of the invention. Furthermore, the phosphate backbone modification may be a 3' inter-

nucleotide linkage modification. In such a case, the modification may occur, for instance, at the last two nucleotides of the 3' end of the oligonucleotide of the invention. Even more preferably, the immunostimulatory oligonucleotide of the invention may be stably modified so as to comprise a
5 phosphorothioate-linked nucleotide (i.e. at least one of the phosphate oxygens is replaced by sulfur). In the most preferred embodiment, most if not all the nucleotides of the immunostimulatory oligonucleotides of the invention comprise a phosphorothioate-linked nucleotide.

Other stabilized oligonucleotides may alternatively include: nonionic DNA
10 analogs, such as alkyl- and aryl- phosphonates (in which the charged phosphonate oxygen is replaced by an alkyl or aryl group), phosphodiester and alkylphosphotriesters, in which the charged oxygen moiety is alkylated. Oligonucleotides which contain a diol, such as tetraethyleneglycol or hexaethyleneglycol, at either or both termini have also been shown to be
15 substantially resistant to nuclease degradation.

The present invention provides methods to augment the immune response of animals of the order *Primate*, including humans, adding one or more of the oligonucleotides of this invention to vaccines, or performing a treatment based on the administration of one or more of the oligonucleotides of this
20 invention to a person with a tumoral disease or an immunological disorder, or contacting "ex vivo" white blood cells obtained from a person with a tumoral disease or an immunological disorder with one or more of the

oligonucleotides of this invention and readministering these activated white blood cells to the same person.

Vaccine compositions containing one or more of the oligonucleotides of this invention can present antigens directly (i.e. in the form of a defined protein or polysaccharide) or as a part of a complex biological entity (i.e. complete
5 viruses; complete bacterial cells; bacterial membranes or artificial conjugates like polysaccharide-protein conjugates). These antigens can be combined in multiple vaccines.

A vaccine composition including at least one antigen is formulated to include
10 one or more of the oligonucleotides of this invention.

For example the antigen can be *Moraxella catharralis* killed cells or subcellular fractions of these cells or *Hepatitis B virus* surface antigen, either natural or produced by means of the DNA recombinant technology.

One or more of the oligonucleotides of this invention may be formulated alone
15 or together with one or more antigens in a pharmaceutical composition, which may also include carriers, thickeners, diluents, buffers, preservatives, surface active agents, anti-microbial agents, anti-inflammatory agents, anesthetics and the like.

The formulation can be liquid or lyophilized. The pharmaceutical composition
20 may be administered in a number of ways depending of whether local or systemic treatment is desired, and on the area to be treated. Administration may be done topically, orally, by inhalation or parenterally. Formulation for

topical administration may include ointments, lotions, creams, gels, drops, suppositories, sprays, liquids and powders. Pharmaceutical carriers, aqueous, powder or oily bases, thickeners and the like may be necessary or desirable. Formulations for oral administration include powders or granules, suspensions or solutions in water or non-aqueous media, capsules, tablets and the like. Thickeners, flavorings, diluents, emulsifiers and the like may be necessary or desirable. Formulations for parenteral administration include sterile aqueous solutions, which may also contain buffers, diluents and other additives. A vaccine containing one or more antigens and one or more of the oligonucleotides of this invention can be formulated and used for prophylactic or therapeutic purposes.

Common antigens used in viral prophylactic vaccines are from *Hepatitis B virus*, *Hepatitis A virus* and *Influenza virus*. Common antigens used in bacterial prophylactic vaccines are from *Streptococcus pneumoniae*, *Haemophilus influenzae*, *Moraxella catharralis*, *Klebsiella pneumoniae* and *Mycobacterium bovis* (BCG). Common antigens used in therapeutic vaccines are from *Papilloma virus*, *HIV virus* and melanoma cells.

A further refinement of a vaccine formulation is to incorporate one or more of the oligonucleotides of this invention as adjuvant/s and the antigen/s into a delivery vehicle to provide for delayed release of the active compounds of the vaccine over time. This can be accomplished by various means known in the art. Examples of these means are encapsulation into Poly (lactide-coglicolide)

- micro particles (Kersten, G.F.A. and Gander, B. 1996. Biodegradable Micro Spheres as vehicles for antigens, in: S.H.E. Kaufmann, ed. Concepts in Vaccine Development. Walter de Gruyter. Berlin-New York), liposomes (Gregoriadis, G. et al. 2000. Liposomes as Immunological Adjuvants and Vaccine Carriers, in: S.H.E. Kaufmann, ed. Concepts in Vaccine Development. Walter de Gruyter. Berlin-New York) and poly (methyl methacrylate) nanoparticles (Kreuter, J. 2000. Poly (Methyl Methacrylate) nanoparticles as vaccine adjuvants, in: S.H.E. Kaufmann, ed. Concepts in Vaccine Development. Walter de Gruyter. Berlin-New York).
- 10 Another refinement of the vaccine formulation is to conjugate the antigen/s and one or more of the oligonucleotides of this invention, by chemical means (Mier W, Eritja R, Mohammed A, Haberkorn U, Eisenhut M.2000. Preparation and evaluation of tumor-targeting peptide-oligonucleotide conjugates. Bioconjug. Chem. 11:855).
- 15 Many vaccine formulations are known in the art and can be used by substituting one or more of the oligonucleotides of this invention for the adjuvant previously known or by simply adding one or more of the oligonucleotides of this invention to the original formulation.
- Based on their immunostimulatory properties, one or more of the oligonucleotides of this invention can also be administered to a subject in vivo
- 20 to treat a tumoral disease or an immune system disorder.

Examples of common tumoral diseases are: Chronic Myelogenous Leukemia, Melanoma, Kaposi's Sarcoma, Multiple Myeloma, Renal Cell Carcinoma, Bladder Cancer, Lung Cancer, Skin Cancer, Breast Cancer, Colon Cancer and Uterus Cancer. Examples of common immunological disorders are:

5 Allergy, Severe Combined Immunodeficiency, Chronic Granulomatous disease, and Acquired Immunodeficiency Disease.

The pharmaceutical composition for these treatments may include one or more of the oligonucleotides of this invention together with carriers, thickeners, diluents, buffers, preservatives, surface active agents, anti-
10 microbial agents, anti-inflammatory agents, anesthetics and the like. The formulation can be liquid or lyophilized.

The pharmaceutical composition may be administered in a number of ways depending on whether local or systemic treatment is desired, and on the area to be treated. Administration may be done topically, orally, by inhalation or
15 parenterally.

Formulation for topical administration may include ointments, lotions, creams, gels, drops, suppositories, sprays, liquids and powders. Pharmaceutical carriers, aqueous, powder or oily bases, thickeners and the like may be necessary or desirable. Formulations for oral administration include powders or granules, suspensions or solutions in water
20 or non-aqueous media, capsules, tablets and the like. Thickeners, flavorings, diluents, emulsifiers and the like may be necessary or desirable. Formulations for parenteral administration include sterile aqueous solutions, which may

also contain buffers, diluents and other additives. Alternatively, one or more of the oligonucleotides of this invention can be contacted "ex vivo" with immunocompetent cells (i.e. B cells or plasmacytoid dendritic cells) obtained from a subject having a tumoral disease or an immune system deficiency and activated cells can then be reintroduced in the subject.

As it will be apparent from the following examples the preferred oligonucleotides are those which stimulate "in vitro" cells of the immune system of an animal of the order Primate with an activity of at least 60% of the immunostimulatory activity of the well known CpG ODN 2006, under the same experimental conditions and using identical chemical backbone (i.e the strong immunostimulatory oligonucleotides).

Among these are preferred those having about 14 to 40 nucleotides and wherein $X_3X_4X_5X_6X_7X_8$ consists of TTTTGT, the most preferred strong immunostimulatory oligonucleotide being IMT 504, namely TCATCATTTTGTTCATTTTGTTCATT (SEQ ID N°2).

EXAMPLE 1

Materials and Methods

The following materials and methods were generally used throughout the examples.

1) Oligonucleotides

Oligonucleotides having phosphorothioate internucleotide linkages were purchased, purified by high-pressure liquid chromatography (HPLC), from Operon Technologies (Alameda, California) or Annovis (Aston, Pennsylvania) or Oligos Etc (Bethel, Maine). ODNs were suspended in depyrogenated
5 water, assayed for LPS contamination using the Limulus test and kept at -20 °C until used. Purity was assessed by HPLC and PAGE assays. ODN preparations were used if LPS levels were undetectable.

2) Antibodies

Antibodies used in assays were purchased from Serotec (Raleigh, NC).

10 3) Peripheral blood mononuclear leukocytes (PBMC)

Blood was obtained by venipuncture from healthy donors using heparin as anticoagulant. PMBC were isolated by Ficoll-Hypaque (Sigma Diagnostics Inc., St. Louis, MO) density gradient centrifugation. Briefly, blood samples diluted 1:2 in RPMI-1640 medium (PAA laboratories GmbH, Linz, Austria)
15 supplemented with 2.0 mM L-glutamine and 50.0 µg/ml gentamicin and 20 mM HEPES were centrifuged at 1000 × g for 40 minutes at 20 °C. PMBC were isolated, washed and suspended in medium supplemented with 10 % fetal calf serum.

4) Purification of cells

20 B lymphocytes and plasmacytoid dendritic cells were purified from human PMBC by positive selection using the MACS magnetic cell separation systems (Miltenyi Biotec, Germany).

5) Cell Proliferation assays

- Blood was obtained by venipuncture from healthy donors using heparin as anticoagulant. PMBC were isolated by Ficoll-Hypaque (Sigma Diagnostics Inc., St. Louis, MO) density gradient centrifugation. Briefly, blood samples
5 diluted 1:2 in RPMI-1640 medium (PAA laboratories GmbH, Linz, Austria) supplemented with 2.0 mM L-glutamine and 50.0 µg/ml gentamicin and 20 mM HEPES were centrifuged at 1000 × g for 40 minutes at 20 °C. PMBC were isolated, washed and suspended in medium supplemented with 10 % fetal calf serum.
- 10 PBMC were cultured in RPMI-1640 media supplemented with 10% (v/v) heat inactivated fetal calf serum (FCS), 2.0 mM L-glutamine and 50.0 µg/ml gentamicin. 1×10^5 cells/well were incubated in 96 well microtiter plates (NUNC, Denmark) at 37 °C in a 5% CO₂ humidified atmosphere for 72 hr. PBMC were stimulated with ODNs at 0.375 µg/ml unless otherwise stated.
- 15 Eighteen hours prior to cell harvest, 1 µCi of ³H-Thymidine (Amersham, specific activity: 25 Ci/mmol) was added to each well. Cells were harvested onto glass-fiber filters and ³H incorporation measured by scintillation counting. Standard deviations of quadruplicate wells were <10%.

6) IL6 Assay

- 20 PBMC (3×10^5 /well) were cultured as described above with ODNs (6 µg/ml) for 24 hr. After this, supernatants were collected and IL6 levels measured by

ELISA. Briefly, 96 well micro titer plates (NUNC, Denmark) were coated with anti-IL6 antibodies and blocked with RPMI 1640 media supplemented with 10% (v/v) heat inactivated FCS. IL6 was detected colorimetrically using biotin-labeled antibodies followed by peroxidase-conjugated strepto-avidin
5 and then peroxidase-specific colorimetric substrate. Standard curves were generated using known amounts of recombinant IL6. The detection limit of these assays was 30 pg/ml. All assays were performed in duplicate.

7) IL-10 Assay

PBMC (3×10^5 /well) were cultured as described above with ODNs (1.5 μ g/ml)
10 for 72 hr. After this, supernatants were collected and IL-10 levels measured by ELISA. Briefly, 96 well micro titer plates (NUNC, Denmark) were coated with anti-IL-10 antibodies and blocked with RPMI 1640 media supplemented with 10% (v/v) heat inactivated FCS. IL-10 was detected colorimetrically using biotin-labeled antibodies followed by peroxidase-conjugated strepto-avidin
15 and then peroxidase-specific colorimetric substrate. Standard curves were generated using known amounts of recombinant IL-10. The detection limit of these assays was 20 pg/ml. All assays were performed in duplicate.

8) IL-5 Assay

PBMC (3×10^5 /well) were cultured as described above with ODNs (1.5 μ g/ml)
20 and IL-4 (5 ng/ml) for 72 hr. After this, supernatants were collected and IL-5 levels measured by ELISA. Briefly, 96 well micro titer plates (NUNC, Denmark) were coated with anti-IL-5 antibodies and blocked with RPMI 1640

media supplemented with 10% (v/v) heat inactivated FCS. IL-5 was detected colorimetrically using biotin-labeled antibodies followed by peroxidase-conjugated strepto-avidin and then peroxidase-specific colorimetric substrate. Standard curves were generated using known amounts of recombinant IL-5.

- 5 The detection limit of these assays was 40 pg/ml. All assays were performed in duplicate.

9) IgM Secretion Assay

PBMC (3×10^5 /well) were cultured as described above with ODNs (1.5 μ g/ml) for 72 hr. After this, supernatants were collected and IgM assayed by ELISA.

- 10 Briefly, 96 microtiter plates (NUNC, Denmark) were coated with anti-IgM antibodies and blocked with RPMI 1640 media. IgM was detected colorimetrically using peroxidase-labeled antibodies followed by peroxidase-specific colorimetric substrate. Standard curves were generated using known amounts of purified IgM. The detection limit of these assays was 50 ng/ml. All
15 assays were performed in duplicate.

10) Flow cytometry

- Staining of surface antigens was performed as described (J. Fló and E. Massouh. Age-related changes of native and memory CD4 rat lymphocyte subsets in mucosal and systemic lymphoid organs. Developmental and
20 comparative Immunology 21: 443-453, 1997). Anti CD19 (Clone LT19), CD86 (Clone BU63), CD40 (clone LOB 7/6), CD4 (clone S 3.5), MHC class I (Clone W6/32), MHC class II (Clone WR 18), anti CD4 (Clone S3.5) and anti CD11c

(Clone BU15) antibodies were purchased from Serotec (Raleigh, NC, USA). Apoptosis was estimated using the ANNEXIN V:FITC assay kit from Serotec (Raleigh, NC, USA).

Flow cytometric data of 10,000 cells/sample were acquired on a FACScan
5 (Becton Dickinson Immunocytometry Systems, San Jose, CA). Data were analyzed using the computer program Win MDI, 2.8 , Interface Flow Cytometry Application (Joseph Trotter Copyright 1993-1998).

10 11) Immunization of monkeys against hepatitis B surface antigen (HBsAg) and evaluation of the humoral response

Twelve monkeys of the species *Cebus Apella* (2.5-3.5 Kg) were immunized with a pediatric dose of AgB (Pablo Cassará, Buenos Aires, Argentina) containing 10 µg of HBsAg adsorbed to alumina (25 mg of Al³⁺/ mg of HBsAg). This was administered alone (n= 3, 1 female, 2 males) or combined
15 with indicated phosphorothioate ODN (150 µg/dose) (n=3, 1 female, 2 males). All vaccines were administered intramuscularly (i.m.) in the quadriceps muscle in a total volume of 1 ml. Monkeys were kept in the animal facility of the CEMIC (Centro Médico de Investigaciones Clínicas), Buenos Aires, Argentina. Animals were monitored daily by specialists and weighed once a
20 week. Plasma was recovered by intravenous (i.v.) puncture before and at various times after immunization and immediately assayed for antibodies

using the commercial kit AUSAB (Abbot Laboratories, Illinois, USA). Titers are expressed in milliinternational units per ml.

EXAMPLE 2

5 Selection of oligonucleotide sequences

WO 96/02555 and US 6,239,116 patents teach that to be immunostimulatory, oligonucleotides require sequences containing unmethylated CpG motifs (WO 96/02555, col. 13 lines 19-20 and US 6,239,116, col. 6 lines 1-3). EP 0 468 520 teaches that to be
10 immunostimulatory, oligonucleotides require a palindromic sequence of at least 6 nucleotides long to be satisfactory (EP 0 468 520, col. 11, lines 34-37). Therefore, several non-CpG oligonucleotides, without palindromic sequences of at least 6 nucleotides long were proved using proliferation assays, cell differentiation assays, cytokine IL6 secretion assays and IgM
15 secretion assays performed on human peripheral blood mononuclear leukocytes (PBMC). As a positive control, the CpG oligonucleotide 2006 of composition :

5' TCGTCGTTTTGTCGTTTTGTCGTT 3'

and phosphorothioate bonds described by Hartman and Krieg (Hartmann, G.,
20 Krieg, A.M. 2000. Mechanism and function of a newly identified CpG DNA motif in human primary B cells. J. Immunol. 164:944.) was used. As a background control, either the phosphorothioate oligonucleotide IMT 023

(SEQ ID N^o9) or IMT 022 (SEQ ID N^o8) with very low activity on human cells was used.

Also as a "presumably" negative control an oligonucleotide with the same composition of the oligonucleotide 2006 but in which all the CpG dinucleotides have been replaced by GpC dinucleotides:

5' TGCTGCTTTTGTGCTTTTGTGCTT 3'

was used. This oligonucleotide was named ODN IMT 021 (SEQ ID N^o 1).

Fig. 1 shows a proliferation assay performed with the above described oligonucleotides.

10 It was found, surprisingly, that the non CpG oligonucleotide IMT 021 was as active as the 2006 CpG oligonucleotide in proliferation assays (Fig. 1 and Table 1) if used at 1.5 µg/ml and approximately 40-60% active if used at 0.375 µg /ml.

IMT 021 (SEQ. ID N° 1)

Avg.: Average; N: Number of Data; SD: Standard Deviation; ODN(S): phosphorothioate ODN

5 Immunostimulation was also evaluated by Flow Cytometry using the CD 19 general marker for human B cells and the CD 86 activation marker for human B cells.

Fig. 2 shows the activation of human B cells incubated with the non CpG ODN (S) IMT 021 as compared to the activation induced by incubation with
10 the CpG ODN (S) 2006. As can be observed, both ODNs show similar activation patterns as compared with the ODN(S) IMT 023 background control when used at 1.5 ug/ml.

IL6 secretion was also evaluated in supernatants of PBMC incubated with the CpG ODN (S) 2006 and the non CpG ODN (S) IMT 021 (Table 2).

15

IMT 021 348 384 836 596

IMT 021 (SEQ. ID N^o 1) . ODNs at 1.5 ug/ml

5 Results of this assay also indicate that the non-CpG ODN (S) IMT 021 is an effective immunostimulant when used at 1.5 ug/ml. Therefore, other non-CpG sequence variants of the 2006 oligonucleotide were investigated. Table 3 shows the results for six of these variants in which, the Cs or Gs of all the CpGs of this ODN were replaced by other nucleotides. As can be observed,

10 the Gs of the CpGs in the ODN(S) 2006 are not necessary for B cell proliferation or IL6 secretion. However, modification of the Cs of the CpGs is detrimental if the replacement is for As or Gs but not if it is for Ts. These results clearly indicate that stimulation of the B cell proliferation and IL6 secretion by the ODN(S) 2006 *is not at all associated with integrity of the*

15 *CpG group.*

EXAMPLE 3

25 Effect of structure modification on the immunostimulatory activity of
 non-CpG oligonucleotides: definition of the active motif.

In order to study the influence of the primary structure on the immunostimulatory activity of the non-CpG ODNs, several variants of the 2006 and IMT 021

30 oligonucleotides were synthesized. Table 4 shows the primary structure of some of the IMT 021 variants and the results of a proliferation and IL-6 assays performed in order to evaluate its immunostimulatory activity.

The ODN(S) IMT 021 contains T in positions 7,8,9,10,12,15,16,17,18,20,23 and 24. Replacement of these Ts with As (ODN IMT 022) or Cs (ODN IMT

023) results in a very significant loss of activity (about 76% and 75% respectively) in the proliferation assay and also in the IL-6 secretion assay (84% and 88% respectively). These results indicate that some or all the Ts in positions 7,8,9,10,12,15,16,17,18,20,23 and 24 are critical for the ODN IMT 021 immunostimulatory activity.

TABLE 4

Induction of peripheral white blood cell proliferation and IL-6 secretion by
Phosphorothioate non-CpG oligonucleotides derived from the
immunostimulatory IMT 021 oligonucleotide

IMT 021 (SEQ. ID N° 1); IMT 022 (SEQ. ID N° 8); IMT 023 (SEQ. ID N° 9)							

In order to investigate the composition of the active center (motif) of the non-CpG oligonucleotides, several ODNs were assayed at 0.375 ug/ml(Fig. 3). It was found that:

- a) The presence of TG groups in an oligonucleotide is not at all sufficient (in disagreement with WO 01-22972) for a strong immunostimulation.

For example, ODNs IMT 028, IMT 046, IMT 546, IMT 547 and IMT 550, all of which have two TGs, have very poor activity. On the other hand, ODN IMT 543 that does not possess a TG dinucleotide has the same (low) activity as ODN IMT544, which is an ODN with the same general composition, but which contains two TG dinucleotides.

b) The presence of the tetranucleotide TTTT in an oligonucleotide is not at all sufficient (in disagreement with WO 01-22972) for a strong immunostimulation. For example, ODNs IMT 034, IMT 057, IMT 028, IMT 543 and IMT 544, which have two TTTT motifs, have very poor activity.

c) The presence of more than 25% of Ts is not at all sufficient (in disagreement with WO 01-22972) for a strong immunostimulation. For example, ODNs IMT 034(50% T), IMT 057 (71% T), IMT 028 (33% T), IMT 543(58% T), IMT 544 (50% T), IMT 059 (83% T), IMT 040 (42% T), IMT 046 (33% T), IMT 545 (42% T), IMT 550 (33% T) and IMT 546(42% T), all of which have more than 25% of T, have very poor activity.

d) The presence of more than 25% of Ts plus the presence of TG dinucleotides, is not at all sufficient (in disagreement with WO 01-22972) for strong stimulation. For example, ODN IMT 028, IMT 046, IMT 544 and IMT 546, which have more than 25% of Ts and two TGs, have very poor activity.

- 5 e) The presence of more than 25% of Ts plus the presence of the tetranucleotide TTTT, is not at all sufficient (in disagreement with WO 01-22972) for strong stimulation. For example, ODN IMT 059, IMT 034, IMT 057, IMT 028, IMT 543 and IMT 544, which have more than 25% of Ts and two TTTT, have very poor activity.
- f) The presence of TG dinucleotides plus the presence of the tetranucleotide TTTT is not at all sufficient (in disagreement with WO 01-22972) for strong stimulation. For example, ODN IMT 028 and IMT 544, which have two TGs and two TTTT, have very poor activity.
- 10 g) The presence of TG dinucleotides plus the presence of the tetranucleotide TTTT, plus the presence of more than 25% Ts, is not at all sufficient (in disagreement with WO 01-22972) for strong stimulation. For example, ODN IMT 028 and IMT 546, which have two TGs, two TTTT and more than 25% Ts, have very poor activity.
- 15 h) Some Ts may be relevant for the activity of non CpG ODNs, but they are not necessarily related to a TG dinucleotide or to a TTTT motif. For example, the replacement of 2 Ts in ODN IMT 540, which are not involved in any TG or TTTT motif, is strongly detrimental (ODN 545). It is worth noting that both, ODN IMT 540 and IMT 545 have more than
- 20 25% T and do not have any TTTT or TG motifs. It is also worth noting that the substitution, in the poorly immunostimulatory ODN IMT 545 of two Ts, that generates two TGs dinucleotides, two TTTT motifs and

increases the total content of Ts (ODN IMT 544) does not increase the activity (in disagreement with WO 01-22972).

- 5 i) The presence of the tetranucleotide CCCC and/or more than 50% of Cs is not at all sufficient (in disagreement with WO 01-22972) for a strong immunostimulation. For example, ODNs IMT 023, which have two CCCC and 63% of C, have very poor activity.
- j) Replacement of some Ts for Cs or Gs in some T-rich oligonucleotides increases the activity (in disagreement with WO 01-22972). For example, replacement of 3 Ts in ODN IMT 059 by Cs (ODN IMT 037) 10 increases the activity in a statistically significant manner. Therefore, the presence of Cs combined with some Ts may be relevant to achieve strong immunostimulation.
- k) In general, T-rich oligonucleotides may have some immunostimulatory activity in a phosphorothioate backbone, but are inactive in a 15 phosphodiester backbone (in disagreement with WO 01-22972). For example, Table 5 shows that IMT 053, which consists of a polyT chain 24 nucleotides long, is able to stimulate the secretion of IL6 in a phosphothioate backbone, but not in a phosphodiester backbone. The same is true for ODN IMT 021, which contains more than 25% T and 6 20 TG dinucleotides. These two ODNs are also unable, in a phosphodiester backbone, to stimulate the expression of the

activation markers CD 86, CD 40 and MHC class I on CD 19 positive (B) cells (Fig. 4).

- 5 I) In general, immunostimulatory oligonucleotides in a phosphodiester backbone are inactive as a double strand (in disagreement with WO 01-22972). For example, the strong stimulatory ODNs 2006 and IMT 504 are inactive as a double strand (not shown). Similar results were described in mice in the following publication: Zelenay, S., Elias, F. and Flo, J. Eur. J. Immunol. 33: 1382-92 (2003).

10 Taking into account all these facts, it was investigated which one is the minimal sequence necessary and sufficient that should be present in a non-CpG oligonucleotide in order to obtain a strong immunostimulatory activity, in a phosphodiester (natural) as well as in modified backbones.

(S): phosphorothioate. (O): phosphodiester. Phosphorothioate ODNs were added (6 µg/ml) at time 0 of incubation. Phosphodiester ODNs were added as follows: 30 µg/ml at time 0, 30 µg/ml after 4 hr and 30 µg/ml after 16 hr of incubation.

The analysis of hundreds of ODNs (not shown) allowed definition of a core sequence (*motif*) responsible for the strong immunostimulatory activity of non-CpG ODNs as measured by B cell proliferation and IL6 secretion. This *motif* is the following:

wherein X_1 is C or T

15 wherein X_2 is C, T, G or A;

wherein X_3 is T or A;

wherein X_4 is T, C or G;

wherein X_5 is T, C or G;

wherein X_6 is T or G;

20 wherein X_7 is G;

wherein X_8 is T

wherein at least two of X_3 , X_4 , X_5 and X_6 are Ts

Table 6 shows the effect of changes in each of the nucleotides of the two non-CpG motifs present in the ODN IMT 504 (motif: CATTTTGT). Replacement of the C in position 1 of the motif by A (ODN IMT 531) or G (ODN IMT 533) resulted in a loss of about 50% in the activity. However, replacement of this C by T (ODN IMT 532) did not change the activity. Thus, in order to obtain maximal activity the first position of the motif should be occupied by a pyrimidine nucleotide (C or T). In position 2 of the motif, A (ODN IMT 504) or T (ODN IMT 535) or C (ODN IMT 534) are equivalent options.

10 In order to study the influence of a G nucleotide in position 2 of the motif without introduction of a CpG dinucleotide, ODNs with a T in the first position of the motif were synthesized (Table 7). As can be observed, any nucleotide in the second position of the motif is equivalent.

Replacement of the G in position 7 of the motif by A (ODN IMT 541), T (ODN IMT 542) or C (ODN IMT 543) is detrimental (Table 5). Thus, in order to obtain maximal activity position 7 of the motif should be preferably G.

Regarding the positions of the motif occupied by Ts, the most sensitive is the one in position 8. Replacement of this T for A (ODN IMT543) or C (ODN IMT599) or G (ODN IMT 604) is detrimental. Thus, in order to obtain maximal activity, position 8 of the motif should be preferably T. In position 3 of the motif the T could be replaced by A (ODN IMT IMT537) without activity loss. However, replacement of this T by C (ODN IMT595) or G (ODN-IMT600) is

detrimental. Thus, in order to obtain maximal activity, position 3 of the motif should be preferably T or A. In position 4 of the motif the T could be replaced by C (ODN IMT IMT596) or G (ODN IMT601) without significant activity loss. However, replacement of this T by A (ODN IMT538) is detrimental. Thus, in order to obtain maximal activity, position 4 of the motif should be preferably T or C or G. In position 5 of the motif, the T could be replaced by C (ODN IMT IMT597) or G (ODN IMT602) without significant activity loss. However, replacement of this T by A (ODN IMT539) is detrimental. Thus, in order to obtain maximal activity, position 5 of the motif should be preferably T or C or G. In position 6 of the motif, the T could be replaced by G (ODN IMT IMT603) without significant activity loss. However, replacement of this T by A (ODN IMT540) is detrimental. Thus, in order to obtain maximal activity, position 6 of the motif should be preferably T or G.

Simultaneous replacement of T by A in position 3 of the motif and T by G in position 6 of the motif did not result in any loss of activity (ODN IMT 608). However, in this case and in order to obtain maximal activity, positions 4 and 5 should be occupied by Ts (see ODNs IMT609, IMT610, IMT611, IMT612 and IMT614).

Replacement of two or more of the Ts by As within the motif results in more than 70% loss of activity (ODNs IMT 545, IMT 546, IMT 547, IMT 548, IMT 549, IMT 550, IMT 551 and IMT 552).

Taking these results into consideration, it can also be concluded that in order to obtain a strong immunostimulatory activity, two or more of the positions 3,4,5 and 6 of the motif should be occupied by Ts.

To investigate the effect of changes in the position of the motif within the ODN chain, the non-CpG motif CATT TTGT present in ODN IMT504 was introduced into different locations in a 24-nucleotide long poly T chain (Fig. 5). As can be seen, the poly T ODN (S) by itself had a significant mitogenic activity. On the other hand, introduction of only one CATT TTGT motif resulted in an increment of 1.2 to 1.8 times (measured by proliferation assays), or 2.4 to 3.5 times (measured by IL-6 secretion assays) in the immunostimulatory activity of the polyT chain, depending on where the motif was located. A distance of at least two nucleotides from the 5' end or four from the 3' end seems to be necessary in order to reach maximal activity (ODNs IMT174 to IMT 179). Introduction of two motifs in optimal positions (ODN IMT182) resulted in an increment of 1.9 times (measured by proliferation assays), or 2.9 times (measured by IL-6 secretion assays) in the immunostimulatory activity of the polyT chain. This indicates that the contribution of the second motif is negligible. On the other hand, the activity of the most effective ODNs like ODN IMT504 is more than 3 times larger than the activity of the poly T as measured by proliferation assays, a fact which suggests that there is also a significant influence of the composition of at least some of the nucleotides surrounding the motif of this invention on the overall activity of the ODN.

20

EXAMPLE 4

Effect of structure modification on the immunostimulatory activity of

non-CpG oligonucleotides of this invention: influence of the nucleotide
composition outside of the active motif.

Results shown in Fig. 5 indicate that composition of the oligonucleotide outside of the non-CpG core motif is important in order to reach optimal immunostimulatory activity. Therefore, a number of oligonucleotides were synthesized with changes in the composition of the nucleotides surrounding the motifs. Table 8 shows the effect of changes in the composition of the first four nucleotides of the 5' end and of the last four nucleotides of the 3' end in the immunostimulatory activity of ODN IMT 504. As can be observed, the best choices are: C or G in position -1 respect to the two motifs, C, T or G in position -2, any nucleotide in positions -3 and -4, A or T in position +1, G in position +2, any nucleotide in positions +3 and G in position +4 .

Of course, other nucleotide combinations not represented in this table may have equal or even better effect on the activity of the non-CpG immunostimulatory oligonucleotides. One of ordinary skill in the art can empirically determine other effective combinations.

EXAMPLE 5

Effect of structure modification on the immunostimulatory activity of

- 10 non-CpG oligonucleotides of this invention: influence of the size of the
oligonucleotide

Table 9 shows that ODNs with one immunostimulatory motif are active if the chain is 16 or more nucleotides long. Activity is maximal if the ODN is between 20 and 25 nucleotides long. *All the ODNs of within this range bearing at least one non-CpG motif of this invention assayed during this study (more than hundred) were very active.*

TABLE 9

Effect of the size of phosphorothioate non-CpG oligonucleotides on B cells proliferation and IL6 secretion

EXAMPLE 6

Induction of peripheral white blood cell IgM secretion by phosphorothioate non-CpG oligonucleotides of this invention

Induction of IgM secretion in peripheral white blood cells is another important marker of immunostimulatory activity of oligonucleotides. Table 10 shows the

stimulation of IgM secretion by several of the phosphorothioate non-CpG oligonucleotides described above. As can be observed, the most active non-CpG ODN(S)s in induction of proliferation and IL6 secretion are also the best in induction of IgM secretion.

5

TABLE 10

Induction of peripheral white blood cell IgM secretion by phosphorothioate non-CpG oligonucleotides of this invention

ODN (S)	SEQUENCE (5'-3')	IgM SECRETION (ng/ml) (ODN at 1.50 µg/ml)

10

EXAMPLE 7

Stimulation of the expression of CD40, MHC I and MHC II in B lymphocytes by phosphorothioate non-CpG oligonucleotides of this invention

Human PMBC were incubated with ODN IMT 504, ODN 2006 as a positive control and ODN IMT 022 as a negative control (Fig 6). As can be observed, ODN IMT 504 is as active as the CpG ODN 2006 for stimulation of the expression of CD40, MHC I and MHC II on B lymphocytes.

5

EXAMPLE 8

Stimulation of purified B lymphocytes by non-CpG oligonucleotides of this invention

Human CD19⁺ (B) cells were purified to more than 95% purity. Table 11 and Fig. 7 show that the immunostimulatory activity on these purified cells is comparable to the one observed using human PMBC. These results indicate that stimulation by the non-CpG oligonucleotides of this invention on human cells is direct.

EXAMPLE 9

Immunostimulation by phosphodiester non-CpG oligonucleotides of this invention

5 Fig 8 and Table 12 show the effect of phosphodiester non-CpG oligonucleotides of this invention on human PMBC. Since phosphodiester oligonucleotides are very sensitive to nucleases they were added to the culture three times (0, 4, and 16 hr) to a final concentration of 30 µg/ml. A very potent phosphodiester CpG ODN (ODN 2080) was used as positive control in cytometric assays (Hartmann G, Weeratna R, Ballas ZK, Payette P, Suparto, I, Rasmussen WL, Wadschmidt M, Sajuthi D, Purcells RH, Davis HL, Krieg AM. Delineation of a CpG phosphorothioate oligodeoxynucleotide for activating primate immune responses *in vitro* and *in vivo*. J. Immunol.164, 1617-1624, (2000)). As can be observed, under these conditions, 10 phosphodiester ODNs bearing non-CpG motifs of this invention have immunostimulatory activity. Regarding this, it is worth noting the differences of these non-CpG ODNs with those non-CpG ODNs claimed in WO 01/22972 (see table 5 and Fig 4).

TABLE 12

20 Immune-stimulation by phosphodiester non-CpG oligonucleotides of this invention

IMT 506	TCTTCTTTTGTCTTTTGTCTTT	403	3	220
2006	TCGTCGTTTGTCTTTTGTCTTT	228	4	40

IMT 022 (SEQ. ID N° 8); IMT 504 (SEQ ID N°2); IMT 053 (SEQ ID N°19); IMT 506 (SEQ ID N°4)

EXAMPLE 10

Induction of cell proliferation in peripheral white blood cells of monkeys of the species *Cebus apella* and *Macaca fascicularis* by non-CpG ODN(S)s of this invention

Non-CpG ODN(S)s of this invention are not very effective immunostimulants in mice, pigs and sheep. However, they are effective in monkeys. For example, Fig.9 shows the immunostimulatory activity of non-CpG ODN(S)s on peripheral white blood cells of monkeys of the species *Cebus apella* and *Macaca fascicularis*. According to these results the most effective non-CpG ODNs in non human primates are those bearing the CATTGTTGT motif. Therefore, monkeys can be used as animal models for research on clinical applications of these non-CpG ODN(S)s.

EXAMPLE 11

Vaccination of subjects

Vaccine formulations containing the non-CpG ODNs adjuvant of this invention can be used to vaccinate subjects against a variety of bacterial and viral disease agents and against tumor cells. Table 13 shows the effect of inoculation of monkeys of the species *Cebus apella* with a vaccine formulation that includes recombinant Hepatitis B surface antigen (rHBsAg) and alumina in presence or absence of ODN IMT 504 as adjuvant.

TABLE 13

10. Anti-HBs responses in *Cebus apella* immunized against HBsAg with IMT

ODNs

ODN (S)	Pre - prime	Post - prime		Post - boost
		14 days	28 days	14 days
None	0	0,4 ± 0,1	14 ± 20	190±52
IMT 504	0	10 ± 14	113 ± 114	659±296
2006	0	22 ± 24	67 ± 57	705±315

15. As can be observed, there is a dramatic increment in the title of anti-HBsAg in animals vaccinated with HBsAg plus IMT ODN(S) 504 as compared with those vaccinated with HBsAg alone. CpG ODN 2006 has a performance as adjuvant similar to the non-CpG ODNs of this invention.

In particular, a human can be vaccinated against hepatitis B by administration
20 of a vaccine formulation that includes recombinant Hepatitis B surface

antigen (rHBsAg) and alumina and one or more of the oligonucleotides of this invention as adjuvants. The amount of rHBsAg in each dose, and the administration schedule, can vary according to the age of the human. For example, for humans from about birth to about 12 years old, a three-dose schedule of about 2.5 μg to about 5 μg of rHBsAg can be administered at 0, 1-3 months afterward and 4-18 months afterward, preferably at 0, 2 and 6 months. One or more of the oligonucleotides of this invention can be present in the formulation from about 10 μg to about 1,000 μg per dose.

For humans from about 12 to about 60 years old, a three-dose schedule of about 5 μg to about 40 μg of rHBsAg can be administered at 0, 1-3 months afterward and 4-18 months afterward, preferably at 0, 2 and 6 months. One or more of the oligonucleotides of this invention can be present in the formulation from about 10 μg to about 1,000 μg per dose.

EXAMPLE 12

Stimulation of the expression of costimulatory molecules in malignant B-lymphocytes by phosphorothioate non-CpG oligonucleotides

The stimulation of malignant B lymphocytes recovered from blood of patients suffering from chronic lymphocytic leukemia (CLL) by phosphorothioate non-CpG oligonucleotides of this invention was examined by flow cytometric (FACS) analysis. The results of a typical FACS analysis are shown in Fig. 10.

As can be seen, the phosphorothioate non-CpG oligonucleotide IMT 504 of this invention is able to stimulate expression of CD86, CD40 and MHC class I surface costimulatory molecules on malignant B lymphocytes so well as the CpG ODN 2006.

EXAMPLE 13

Stimulation of malignant B cell apoptosis by phosphorothioate non-CpG oligonucleotides

The stimulation of apoptosis in malignant B lymphocytes recovered from blood of patients suffering from chronic lymphocytic leukemia (CLL) by phosphorothioate non-CpG oligonucleotides of this invention was examined by flow cytometric (FACS) analysis using as apoptosis markers propidium iodide and annexin V. The result of a typical FACS analysis are shown in Fig 11. As can be observed, the non CpG oligonucleotide IMT 504 of this invention is able to increase the apoptosis of the leukemia cells so well as the CpG ODN 2006.

EXAMPLE 14

Stimulation of the expression of costimulatory molecules on plasmacytoid dendritic cells by phosphorothioate non-CpG oligonucleotides of this invention

The stimulation of plasmacytoid dendritic cells recovered from blood of normal donors by phosphorothioate non-CpG oligonucleotides of this invention was examined by flow cytometric (FACS) analysis. The results of a

typical FACS analysis are shown in Fig. 12. As can be seen, the phosphorothioate non-CpG oligonucleotide IMT 504 of this invention is able to stimulate expression of CD86, CD40 and MHC class I surface molecules on plasmacytoid dendritic cells so well as the CpG ODN 2006.

5

Table 14 shows that the non-CpG oligonucleotides of this invention are also able to stimulate purified human plasmacytoid dendritic cells to secrete interferon alpha if the oligonucleotide backbone is phosphodiester.

10

TABLE 14

Interferon alpha secretion by purified plasmacytoid dendritic cells incubated with phosphorothioate and phosphodiester non-CpG oligonucleotides of this invention

ODN	SEQUENCE (5'-3')	IFN Alpha Secretion (pg/ml)		
		Avg.	N	SD
IMT 022 (S)	TGCTGCAAAAGAGCAAAAGAGCAA	<31	3	—
IMT 504 (S)	TCATCATTTTGTTCATTTTGTTCATT	<31	3	—
IMT 022 (O)	TGCTGCAAAAGAGCAAAAGAGCAA	<31	3	—
IMT 504 (O)	TCATCATTTTGTTCATTTTGTTCATT	2300	3	632

15 IMT 022 (SEQ. ID N° 8); IMT 504 (SEQ. ID N° 2). Phosphorothioate ODNs were added (1.5 µg/ml) at time 0 of incubation. Phosphodiester ODNs were added as follows: 30 µg/ml at time 0, 30 µg/ml after 4 hr and 30 µg/ml after 16 hr of incubation.

EXAMPLE 15

Treatment of subjects with tumoral disease

Pharmaceutical formulations containing one or more of the immunostimulatory oligonucleotides of this invention, can be used to treat subjects against a variety of tumoral diseases. In particular, a human with a Melanoma can be treated by administration of a pharmaceutical formulation
5 containing the oligonucleotide of this invention as the active component. The amount of oligonucleotide in each dose, and the administration schedule, can vary according to the corporeal mass of the subject and stage in tumor progression. For example, for a human of about 70 kg who has an advanced, unresectable metastatic melanoma, a dose of about 1 mg of the
10 oligonucleotide of this invention can be administered 3 times per week for about 10 weeks.

EXAMPLE 16

Induction of peripheral white blood cell IL-10 secretion and inhibition of IL-5 secretion by phosphorothioate non-CpG oligonucleotides of this invention

15 IL-10 is a potent suppressor of IgE production and induction and maintenance of epitope-specific T cell anergy is associated with increased IL-10. Fig 13 shows the stimulation of IL-10 secretion by the phosphorothioate non-CpG oligonucleotide IMT 504 and controls in PMBCs of several donors. As can be observed, IMT 504 is as active as the CpG positive control ODN 2006.
20 Allergen-specific Th2 cells produce IL-5, which promotes the differentiation, activation and survival of eosinophils. Fig 14 shows that the phosphorothioate non-CpG oligonucleotide IMT 504 and the CpG positive control ODN 2006

are repressors of the production of IL-5 in several human PMBCs induced by IL-4 + Con A.

EXAMPLE 17

Treatment of subjects with allergic disease

5 Pharmaceutical formulations containing one or more of the immunostimulatory oligonucleotides of this invention, can be used to treat subjects against a variety of allergic diseases.

In particular, a human with asthma can be treated by administration in the respiratory tract of an aerosolized pharmaceutical formulation containing the
10 oligonucleotide of this invention as the active component. The amount of oligonucleotide in each dose, and the administration schedule, can vary according to the subject.

Oligonucleotide sequences which are outside the scope of the invention

15 The following oligonucleotide sequences (disclosed in the above listed prior art publications) are excluded from the scope of the immunostimulatory oligonucleotide claims; they might however be comprised within the scope of the composition and use claims:

CLAIMS

1. An immunostimulatory oligonucleotide having about 14 to 100 nucleotides, comprising a non-palindromic nucleic acid sequence motif having the following formula:

wherein X_1 is C or T, X_2 is C, T, G or A, X_3 is T or A, X_4 is T, C or G, X_5 is T, C or G, X_6 is T or G, X_7 is G and X_8 is T and wherein at least two of X_3 , X_4 , X_5 and X_6 are T; with the proviso when X_1 is C, X_2 is T, G or A and
10 that, in the motif, a C does not precede a G.

2. An immunostimulatory oligonucleotide having about 14 to 100 nucleotides, comprising a non-palindromic nucleic acid sequence motif having the following formula:

wherein X_1 is C, X_2 is T, G or A, X_3 is T or A, X_4 is T, C or G, X_5 is T, C or G, X_6 is T or G, X_7 is G and X_8 is T and wherein at least two of X_3 , X_4 , X_5 and X_6 are T; with the proviso and that, in the motif, a C does not precede a G.

- 20 3. The immunostimulatory oligonucleotide of claim 1, wherein X_1 is C.
4. The immunostimulatory oligonucleotide of claims 1-2, wherein all of X_3 , X_4 , X_5 , X_6 and X_8 are T.
5. The immunostimulatory oligonucleotide of claims 1-4, wherein $X_3X_4X_5X_6X_7X_8$ consists of TTTTGT.

6. The immunostimulatory oligonucleotide of claims 1-2 wherein X_1 is C, X_3 is T or A, X_4 is T, X_5 is T, X_6 is T or G, X_7 is G and X_8 is T.

7. The immunostimulatory oligonucleotide of claim 1 having about 14 to 40 nucleotides.

5 8. The immunostimulatory oligonucleotide of claim 1 having a modified phosphate backbone.

9. The immunostimulatory oligonucleotide of claim 8 having a phosphate backbone modification on the 5' inter-nucleotide linkages.

10 10. The immunostimulatory oligonucleotide of claim 8 having a phosphate backbone modification on the 3' inter-nucleotide linkages.

11. The immunostimulatory oligonucleotide of claims 1-8 wherein at least one of the internucleotide linkages is a phosphorothioate linkage.

12. The immunostimulatory oligonucleotide of claims 1-11, having a sequence comprising:

15 $5'-N X_1 X_2 X_3 X_4 X_5 X_6 X_7 X_8 N-3'$

wherein N is an oligonucleotide composed of about 3-46 nucleotides, preferably of about 3-25 nucleotides.

13. The immunostimulatory oligonucleotide of claim 12, having a sequence comprising:

20 $5'-NCX_2 TTTTGTN-3'$

wherein X_2 is T or G or C or A.

14. An immunostimulatory oligonucleotide which consists of a nucleotide sequence selected from:

10 17. The immunostimulatory oligonucleotide of claims 1-16 wherein the immunostimulatory oligonucleotide is encapsulated in a slow release delivery vehicle.

18. The immunostimulatory oligonucleotide of claims 1-16 wherein the immunostimulatory oligonucleotide is included in a pharmaceutically acceptable carrier.

15 19. A pharmaceutical composition comprising an immunostimulatory oligonucleotide according to claims 1-16 and a pharmaceutically acceptable carrier.

20. A composition according to claim 19 wherein said immunostimulatory oligonucleotide is included in a plasmid.

20 21. A composition according to claim 19 further comprising an antigen.

22. A composition according to claim 21 wherein the antigen is selected from the group consisting of viruses, bacteria, fungi, parasites, tumoral cells, toxins, allergens, proteins, glycolipids and polysaccharides.

23. A composition according to claim 21 wherein the antigen is a viral antigen,
5 a bacterial antigen, a human or animal tumoral cell and/or a fungal antigen.

24. A composition according to claim 21 wherein the antigen is encoded by a plasmid.

25. A composition according to claims 19-24 which is in liquid or lyophilized
10 form.

26. Use of an immunostimulatory oligonucleotide according to claims 1-16 for the manufacture of a medicament for inducing B-cell activation; for treating, preventing or ameliorating an immune system disorder; for treating, preventing or ameliorating a tumoral disease; and/or for inducing
15 plasmacytoid dendritic cell activation in a subject.

27. The use of claim 26, wherein the subject is a human.

28. The use of claim 26 wherein the oligonucleotide has been conjugated with one or more antigens.

29. The use of claim 26 wherein the oligonucleotide and the antigen are
20 administered contemporaneously or simultaneously.

30. The use of claim 26 wherein the medicament is administered by intramuscular, oral, intranasal, anal, vaginal or transdermic route.

25 (2) INFORMATION FOR SEQ ID N°45 (IMT 552):

(A) SEQUENCE CHARACTERISTICS:

- (A) LENGTH: 24 base pairs
- (B) TYPE: nucleic acid
- (C) STRANDEDNESS: single
- (D) TOPOLOGY: linear

5 (B) MOLECULE TYPE: DNA

(C) SEQUENCE DESCRIPTION: SEQ ID N° 45:

TCATCAAAAAGACAAAAGACATT

10 (2) INFORMATION FOR SEQ ID N°46 (IMT 559):

(A) SEQUENCE CHARACTERISTICS:

- (A) LENGTH: 24 base pairs
- (B) TYPE: nucleic acid
- (C) STRANDEDNESS: single
- 15 (D) TOPOLOGY: linear

(B) MOLECULE TYPE: DNA

(C) SEQUENCE DESCRIPTION: SEQ ID N° 46:

ACATCATTTTGTGTCATTTTGTGTCATT

20 (2) INFORMATION FOR SEQ ID N°47 (IMT 560):

(A) SEQUENCE CHARACTERISTICS:

- (A) LENGTH: 24 base pairs
- (B) TYPE: nucleic acid
- (C) STRANDEDNESS: single
- 25 (D) TOPOLOGY: linear

(B) MOLECULE TYPE: DNA

(C) SEQUENCE DESCRIPTION: SEQ ID N° 47:

CCATCATTTTGTTCATTTTGTTCATT

5

(2) INFORMATION FOR SEQ ID N°48 (IMT 561):

(A) SEQUENCE CHARACTERISTICS:

(A) LENGTH: 24 base pairs

10

(B) TYPE: nucleic acid

(C) STRANDEDNESS: single

(D) TOPOLOGY: linear

(B) MOLECULE TYPE: DNA

(C) SEQUENCE DESCRIPTION: SEQ ID N° 48:

15

GCATCATTTTGTTCATTTTGTTCATT

(2) INFORMATION FOR SEQ ID N°49 (IMT 562):

(A) SEQUENCE CHARACTERISTICS:

20

(A) LENGTH: 24 base pairs

(B) TYPE: nucleic acid

(C) STRANDEDNESS: single

(D) TOPOLOGY: linear

(B) MOLECULE TYPE: DNA

25

(C) SEQUENCE DESCRIPTION: SEQ ID N° 49:

TAATCATTTTGTTCATTTTGTTCATT

(2) INFORMATION FOR SEQ ID N°50 (IMT 563):

(A) SEQUENCE CHARACTERISTICS:

- 5 (A) LENGTH: 24 base pairs
(B) TYPE: nucleic acid
(C) STRANDEDNESS: single
(D) TOPOLOGY: linear

(B) MOLECULE TYPE: DNA

10 (C) SEQUENCE DESCRIPTION: SEQ ID N° 50:

TTATCATTTTGTTCATTTTGTTCATT

(2) INFORMATION FOR SEQ ID N°51 (IMT 564):

15 (A) SEQUENCE CHARACTERISTICS:

- (A) LENGTH: 24 base pairs
(B) TYPE: nucleic acid
(C) STRANDEDNESS: single
(D) TOPOLOGY: linear

20 (B) MOLECULE TYPE: DNA

(C) SEQUENCE DESCRIPTION: SEQ ID N° 51:

TGATCATTTTGTTCATTTTGTTCATT

25 (2) INFORMATION FOR SEQ ID N°52 (IMT 565):

(A) SEQUENCE CHARACTERISTICS:

- (A) LENGTH: 24 base pairs
- (B) TYPE: nucleic acid
- (C) STRANDEDNESS: single
- (D) TOPOLOGY: linear

5 (B) MOLECULE TYPE: DNA

(C) SEQUENCE DESCRIPTION: SEQ ID N° 52:

TCCTCATTTTGTTCATTTTGTTCATT

10 (2) INFORMATION FOR SEQ ID N°53 (IMT 566):

(A) SEQUENCE CHARACTERISTICS:

- (A) LENGTH: 24 base pairs
- (B) TYPE: nucleic acid
- (C) STRANDEDNESS: single
- (D) TOPOLOGY: linear

15

(B) MOLECULE TYPE: DNA

(C) SEQUENCE DESCRIPTION: SEQ ID N° 53:

TCTTCATTTTGTTCATTTTGTTCATT

20

(2) INFORMATION FOR SEQ ID N°54 (IMT 567):

(A) SEQUENCE CHARACTERISTICS:

- (A) LENGTH: 24 base pairs
- (B) TYPE: nucleic acid
- (C) STRANDEDNESS: single
- (D) TOPOLOGY: linear

25

(B) MOLECULE TYPE: DNA

(C) SEQUENCE DESCRIPTION: SEQ ID N° 54:

TCGTCATTTTGTTCATTTTGTTCATT

5

(2) INFORMATION FOR SEQ ID N°55 (IMT 568):

(A) SEQUENCE CHARACTERISTICS:

(A) LENGTH: 24 base pairs

(B) TYPE: nucleic acid

10

(C) STRANDEDNESS: single

(D) TOPOLOGY: linear

(B) MOLECULE TYPE: DNA

(C) SEQUENCE DESCRIPTION: SEQ ID N° 55:

TCAACATTTTGTTCATTTTGTTCATT

15

(2) INFORMATION FOR SEQ ID N°56 (IMT 569):

(A) SEQUENCE CHARACTERISTICS:

(A) LENGTH: 24 base pairs

20

(B) TYPE: nucleic acid

(C) STRANDEDNESS: single

(D) TOPOLOGY: linear

(B) MOLECULE TYPE: DNA

(C) SEQUENCE DESCRIPTION: SEQ ID N° 56:

25

TCACCATTTTGTTCATTTTGTTCATT

(2) INFORMATION FOR SEQ ID N°57 (IMT 570):

(A) SEQUENCE CHARACTERISTICS:

(A) LENGTH: 24 base pairs

5 (B) TYPE: nucleic acid

(C) STRANDEDNESS: single

(D) TOPOLOGY: linear

(B) MOLECULE TYPE: DNA

(C) SEQUENCE DESCRIPTION: SEQ ID N° 57:

10 TCAGCATTTTGTTCATTTTGTTCATT

(2) INFORMATION FOR SEQ ID N°58 (IMT 571):

(A) SEQUENCE CHARACTERISTICS:

15 (A) LENGTH: 24 base pairs

(B) TYPE: nucleic acid

(C) STRANDEDNESS: single

(D) TOPOLOGY: linear

(B) MOLECULE TYPE: DNA

20 (C) SEQUENCE DESCRIPTION: SEQ ID N° 58:

TCATCATTTTGTTCATTTTGTAAATT

(2) INFORMATION FOR SEQ ID N°59 (IMT 572):

25 (A) SEQUENCE CHARACTERISTICS:

(A) LENGTH: 24 base pairs

(B) TYPE: nucleic acid

(C) STRANDEDNESS: single

(D) TOPOLOGY: linear

(B) MOLECULE TYPE: DNA

5 (C) SEQUENCE DESCRIPTION: SEQ ID N° 59:

TCATCATTTTGTTCATTTTGTTATT

(2) INFORMATION FOR SEQ ID N°60 (IMT 573):

10 (A) SEQUENCE CHARACTERISTICS:

(A) LENGTH: 24 base pairs

(B) TYPE: nucleic acid

(C) STRANDEDNESS: single

(D) TOPOLOGY: linear

15 (B) MOLECULE TYPE: DNA

(C) SEQUENCE DESCRIPTION: SEQ ID N° 60:

TCATCATTTTGTTCATTTTGTGATT

20 (2) INFORMATION FOR SEQ ID N°61 (IMT 574):

(A) SEQUENCE CHARACTERISTICS:

(A) LENGTH: 24 base pairs

(B) TYPE: nucleic acid

(C) STRANDEDNESS: single

25 (D) TOPOLOGY: linear

(B) MOLECULE TYPE: DNA

(C) SEQUENCE DESCRIPTION: SEQ ID N° 61:

TCATCATTTTGTTCATTTTGTCTT

5 (2) INFORMATION FOR SEQ ID N°62 (IMT 575):

(A) SEQUENCE CHARACTERISTICS:

(A) LENGTH: 24 base pairs

(B) TYPE: nucleic acid

(C) STRANDEDNESS: single

10 (D) TOPOLOGY: linear

(B) MOLECULE TYPE: DNA

(C) SEQUENCE DESCRIPTION: SEQ ID N° 62:

TCATCATTTTGTTCATTTTGTCTTT

15

(2) INFORMATION FOR SEQ ID N°63 (IMT 576):

(A) SEQUENCE CHARACTERISTICS:

(A) LENGTH: 24 base pairs

(B) TYPE: nucleic acid

20 (C) STRANDEDNESS: single

(D) TOPOLOGY: linear

(B) MOLECULE TYPE: DNA

(C) SEQUENCE DESCRIPTION: SEQ ID N° 63:

~~TCATCATTTTGTTCATTTTGTCTT~~

25

(2) INFORMATION FOR SEQ ID N°64 (IMT 577):

(A) SEQUENCE CHARACTERISTICS:

(A) LENGTH: 24 base pairs

(B) TYPE: nucleic acid

(C) STRANDEDNESS: single

5 (D) TOPOLOGY: linear

(B) MOLECULE TYPE: DNA

(C) SEQUENCE DESCRIPTION: SEQ ID N° 64:

TCATCATTTTGTCAATTTTGTCAAT

10

(2) INFORMATION FOR SEQ ID N°65 (IMT 578):

(A) SEQUENCE CHARACTERISTICS:

(A) LENGTH: 24 base pairs

(B) TYPE: nucleic acid

15 (C) STRANDEDNESS: single

(D) TOPOLOGY: linear

(B) MOLECULE TYPE: DNA

(C) SEQUENCE DESCRIPTION: SEQ ID N° 65:

TCATCATTTTGTCAATTTTGTCACT

20

(2) INFORMATION FOR SEQ ID N°66 (IMT 579):

(A) SEQUENCE CHARACTERISTICS:

(A) LENGTH: 24 base pairs

25 (B) TYPE: nucleic acid

(C) STRANDEDNESS: single

(D) TOPOLOGY: linear

(B) MOLECULE TYPE: DNA

(C) SEQUENCE DESCRIPTION: SEQ ID N° 66:

TCATCATT TTTGTCATT TTTGTCAGT

5

(2) INFORMATION FOR SEQ ID N°67 (IMT 580):

(A) SEQUENCE CHARACTERISTICS:

(A) LENGTH: 24 base pairs

10

(B) TYPE: nucleic acid

(C) STRANDEDNESS: single

(D) TOPOLOGY: linear

(B) MOLECULE TYPE: DNA

(C) SEQUENCE DESCRIPTION: SEQ ID N° 67:

15

TCATCATT TTTGTCATT TTTGTCATA

(2) INFORMATION FOR SEQ ID N°68 (IMT 581):

(A) SEQUENCE CHARACTERISTICS:

20

(A) LENGTH: 24 base pairs

(B) TYPE: nucleic acid

(C) STRANDEDNESS: single

(D) TOPOLOGY: linear

(B) MOLECULE TYPE: DNA

25

(C) SEQUENCE DESCRIPTION: SEQ ID N° 68:

TCATCATTTTGTTCATTTTGTTCATC

(2) INFORMATION FOR SEQ ID N°69 (IMT 582):

5 (A) SEQUENCE CHARACTERISTICS:

(A) LENGTH: 24 base pairs

(B) TYPE: nucleic acid

(C) STRANDEDNESS: single

(D) TOPOLOGY: linear

10 (B) MOLECULE TYPE: DNA

(C) SEQUENCE DESCRIPTION: SEQ ID N° 69:

TCATCATTTTGTTCATTTTGTTCATG

15 (2) INFORMATION FOR SEQ ID N°70 (IMT 187):

(A) SEQUENCE CHARACTERISTICS:

(A) LENGTH: 12 base pairs

(B) TYPE: nucleic acid

(C) STRANDEDNESS: single

20 (D) TOPOLOGY: linear

(B) MOLECULE TYPE: DNA

(C) SEQUENCE DESCRIPTION: SEQ ID N° 70:

TTTTCATTTTGT

25

(2) INFORMATION FOR SEQ ID N°71 (IMT 188):

(A) SEQUENCE CHARACTERISTICS:

- (A) LENGTH: 16 base pairs
- (B) TYPE: nucleic acid
- (C) STRANDEDNESS: single
- (D) TOPOLOGY: linear

5 (B) MOLECULE TYPE: DNA

(C) SEQUENCE DESCRIPTION: SEQ ID N° 71:

TTTTCATTTTGTTTTT

10 (2) INFORMATION FOR SEQ ID N°72 (IMT 189):

(A) SEQUENCE CHARACTERISTICS:

- (A) LENGTH: 20 base pairs
- (B) TYPE: nucleic acid
- (C) STRANDEDNESS: single
- (D) TOPOLOGY: linear

15

(B) MOLECULE TYPE: DNA

(C) SEQUENCE DESCRIPTION: SEQ ID N° 72:

TTTTCATTTTGTTTTTTTTT

20

(2) INFORMATION FOR SEQ ID N°73 (IMT 179):

(A) SEQUENCE CHARACTERISTICS:

- (A) LENGTH: 24 base pairs
- (B) TYPE: nucleic acid
- (C) STRANDEDNESS: single
- (D) TOPOLOGY: linear

25

(B) MOLECULE TYPE: DNA

(C) SEQUENCE DESCRIPTION: SEQ ID N° 73:

TTTTTTTTTTTTCATTTTGTTTTT

5

(2) INFORMATION FOR SEQ ID N°74 (IMT 191):

(A) SEQUENCE CHARACTERISTICS:

(A) LENGTH: 28 base pairs

(B) TYPE: nucleic acid

10 (C) STRANDEDNESS: single

(D) TOPOLOGY: linear

(B) MOLECULE TYPE: DNA

(C) SEQUENCE DESCRIPTION: SEQ ID N° 74:

TTTTCATTTTGTTTTTTTTTTTTTTT

15
